ABSTRACT:

PURPOSE: To obtain a writing method fitted for a pre-processing of a storage characteristic test, by inputting write data of plural number of bits en masses, and arranging the threshold voltage at a regulated level in a repeated process of a rewrite until a readout becomes possible.

CONSTITUTION: At the time of a write data signal D1 of '0' is inputted to a data pin 111, a data signal 101a is written by a write signal 4 on a bit set with an address signal 3. Afterwards, a readout data signal 11a is outputted with a readout signal 5, and an EOR circuit 51 decides a coincidence with the signal 101a, and the rewrite is repeated until the coincidence can be obtained. In case the coincidence is obtained, the output of an OR circuit 101 is changed, and a signal 101a of '1' is rewritten on the same bit. After that, the rewrite is performed until decision for all of the bits in circuits 31~3n coincide. Since the threshold value voltage is not changed by writing '1', the threshold value voltage can be arranged at the regulated level.
